

Canton Network

Infrastructure for institutional digital asset settlement

TradFi is increasingly moving toward tokenized assets and crypto-native settlement infrastructure. This report examines Canton Network, the institutions building on it, and Cumberland's role within emerging digital collateral and liquidity markets.

- Permissionless network with application level privacy
- \$9T+ monthly transaction volume onchain

DRW led \$135M Series E

Cumberland Canton liquidity layer

The infrastructure pain points your desk already lives with

Fragmented liquidity across venues

Capital and collateral locked on one exchange cannot be used elsewhere simultaneously. Every venue is a silo creating capital inefficiency and forcing over-collateralization.

No atomic DvP for OTC block trades

Large OTC block executions carry settlement risk between trade agreement and final settlement. Counterparty exposure windows create credit risk that limits position sizes and relationships.

TradFi capital sitting on the sidelines

Institutional participation in digital assets continues to expand, though settlement fragmentation and compliance considerations remain operational challenges. Canton Network represents one emerging approach designed to improve institutional settlement and collateral mobility.

Canton does not replace existing trading infrastructure. Instead, it introduces a coordination layer designed to reduce operational friction around settlement, collateral mobility, and institutional trading.

Privacy-preserving atomic settlement = purpose-built for institutions

The core idea

Most blockchains force a trade off: public chains expose everything, private chains can't interoperate. Canton is designed to address this by allowing independent applications to share settlement infrastructure while each participant sees only the information relevant to them.

What that means in practice

A repo desk, collateral platform, and payment rail can all settle against each other atomically without any participant seeing full transaction-level data from the others. If any leg fails, the entire transaction rolls back, reducing reconciliation complexity and minimizing settlement exposure.

Public mainnet launched by Digital Asset in July 2024. As of May 2026, Canton supports more than 150 live or emerging institutional and infrastructure-focused applications.

Source: Messari

ATOMIC SETTLEMENT

All legs settle simultaneously. Atomic settlement reduces settlement exposure between counterparties.

CONFIGURABLE PRIVACY

Sub-transaction privacy. Each party sees only its portion. Meets institutional compliance requirements.

COMPOSABILITY

Designed for interoperable execution across trading, collateral, financing, and payment environments.

The largest institutions in traditional finance are building here today

\$8T+

monthly repo volume
Broadridge DLR on Canton

Aug 2025

First real-time onchain U.S. Treasury repo vs USDC

Completed by an industry working group, demonstrating same-day atomic settlement of real collateral.

Feb 2026

Cross-border cross-currency repo goes live

Tokenized UK gilts, LSEG, Lloyds, Euroclear, DTCC, Citadel Securities, Tradeweb, Société Générale.

H2 2026

DTCC tokenizing U.S. Treasury securities on Canton

DTC-custodied Treasuries tokenized to support onchain collateral and settlement workflows.

What this means for crypto-native institutions:

- Tokenized Treasuries and stablecoins increasingly functioning as real-time collateral across trading and financing.
- J.P. Morgan's JPMD integration onto Canton signals growing institutional interest in onchain USD settlement infrastructure.
- Visa's role as a Super Validator reflects growing convergence between traditional payment rails and digital asset settlement infrastructure.

Crypto-native and TradFi institutions building side by side

TRADITIONAL FINANCE

Broadridge	\$8T+/month repo · HQLAX migration
DTCC	Tokenized U.S. Treasuries · H2 2026 MVP
J.P. Morgan	JPMD onchain USD settlement · 2026
Franklin Templeton	Tokenized money market fund (Benji)
Goldman Sachs	GS DAP tokenization infrastructure initiative
HSBC	Tokenized deposit pilot · Apr 2026
Visa	Super Validator · payment settlement
BNP Paribas	Neobonds on Canton

Cumberland / DRW	Institutional liquidity
Circle	USDCx stablecoin settlement on Canton
Fireblocks	Custody infrastructure · validator
Chainlink	Super Validator · CCIP · Data Streams
Euroclear	Cross-border collateral and settlement coordination
BitGo	Custody and settlement infrastructure
zerohash	USDC access on Canton
Mesh	Payment infrastructure · validator

Cumberland's positioning within the Canton ecosystem

\$135M

Series E · June 2025

DRW Venture Capital led Digital Asset's \$135M Series E financing in June 2025, signaling growing strategic interest in Canton financial infrastructure.

Strategic ecosystem positioning

Cumberland participates in the Canton ecosystem as a listed liquidity provider alongside settlement infrastructure firms and market makers supporting emerging digital assets.

Implications for institutional counterparties

Institutional counterparties evaluating Canton-related infrastructure may increasingly prefer liquidity providers already operating within emerging settlement, collateral, and interoperability workflows.

Access to the Canton ecosystem

DRW's lead investor position and ecosystem participation provide Cumberland with close visibility into Canton infrastructure and institutional settlement initiatives.
